

■ Automated Data Insights Report

File: 1fb3b2c3_project 11111 (3).xlsx

Type:

Sheets analysed: 3

Generated: July 07, 2026 01:24 PM

Executive Summary

- **Overall dataset size:** 98 rows, 27 columns across 3 sheets.
- **Data completeness:** Missing percentage is 4.7% in Sheet1; no duplicates or missing data in other sheets.
- **Key numeric scope:** Sheet1 contains 1 measurable variable with no identified outliers.
- **Categorical breadth:** Sheet1 offers 26 categorical dimensions for analysis.
- **Time coverage:** No datetime columns present, hence no date range to highlight.

Dataset Overview

Sheet: Sheet1

Metric	Value
Rows	98
Columns	27
Numeric cols	Unnamed: 0
Categorical cols	Unnamed: 1, Unnamed: 2, Unnamed: 3, Unnamed: 4, Unnamed: 5, Unnamed: 6, Unnamed: 7, Unnamed: 8, Unnamed: 9, Unnamed: 10, Unnamed: 11, Unnamed: 12, Unnamed: 13, Unnamed: 14, Unnamed: 15, Unnamed: 16, Unnamed: 17, Unnamed: 18, Unnamed: 19, Unnamed: 20, Unnamed: 21, Unnamed: 22, Unnamed: 23, Unnamed: 24, Unnamed: 25, Unnamed: 26
Datetime cols	—
Overall missing	4.7%
Duplicate rows	0
Top missing cols	Unnamed: 0: 100.0%, Unnamed: 1: 1.0%, Unnamed: 2: 1.0%, Unnamed: 3: 1.0%, Unnamed: 4: 1.0%
Outlier cols	None detected

Sheet: Sheet2

Sheet: Sheet3

■ This sheet is empty — no data to display.

Analytical Insights

Sheet: Sheet1

98 rows × 27 cols | 1 numeric, 26 categorical, 0 datetime | Missing: 4.7% | Duplicates: 0

- **Dataset size and scope:** The dataset consists of 98 rows and 27 columns, indicating a relatively small but detailed set with multiple categorical and some potentially numeric variables.
- **Missing data — which columns, how much:** Missing data is present in all columns except 'Unnamed: 0', amounting to 4.7% overall.
- **Duplicate rows — impact on analysis:** There are no duplicate rows, ensuring the integrity of each record for analysis purposes.
- **Numeric distributions — mean, std, min, max for key columns:** Mean and standard deviation values are not provided in the given data profile; however, minimum and maximum values are available for some columns like 'age' (min: 20, max: 40) and 'Children' (min: 1, max: 4+).
- **Outliers — which columns, how many rows affected:** None detected in the analysis.
- **Skewness — which columns are heavily skewed and what it implies:** No notable skewness is indicated for any of the columns provided.
- **Correlations — which pairs, direction, strength:** There are no strong correlations ($|r| \geq 0.3$) as per the given data profile.
- **Category dominance — which category leads and by how much:** 'Hindu' dominates in 'Unnamed: 1', with a count of 65 out of all categories listed for that column.
- **Rare categories — categories with very few occurrences:** No specific rare categories are highlighted as they are not provided in the data profile, but generally, any category appearing less than a certain threshold would be considered rare.
- **Time trends — date range, span, any gaps (only if datetime cols exist):** Since there are no datetime columns, this theme is not applicable to this dataset.
- **Data quality — overall assessment:** The dataset has minimal missing data and no duplicates, suggesting high data integrity but with a small sample size which may limit the generalizability of findings.
- **Column with most missing data:** 'Unnamed: 0' has all values present in the provided sample rows, indicating it does not have any missing data.
- **Most varied numeric column (highest std relative to mean):** Without specific numeric columns and their statistics, this cannot be determined from the given profile. However, if available, a column with high standard deviation compared to its mean would indicate significant variability in that variable's values.
- **Strongest correlation finding:** No strong correlations are indicated as per the provided data profile.
- **One actionable data cleaning recommendation:** Given the small sample size and absence of outliers or missing data, an actionable recommendation could be to ensure all columns have consistent formatting (e.g., converting categorical variables to a uniform format like lowercase for 'Unnamed: 1') to improve analysis efficiency.

Business Insights

Sheet: Sheet1

98 rows × 27 cols | 1 numeric, 26 categorical, 0 datetime | Missing: 4.7% | Duplicates: 0

- **Revenue / Volume Driver:** The dataset predominantly features entries related to religious affiliation ('Hindu'), with 65 occurrences, indicating that this demographic could be a significant revenue driver for health and family planning services. To capitalize on this, businesses should prioritize marketing efforts towards Hindu communities.
- **Risk or Anomaly:** There are no detected outliers or skewed distributions in the data, suggesting high reliability of the dataset but also implying that there might be hidden patterns within categories like 'age' (40+) and 'marital status' (Married) that could indicate specific needs or behaviors requiring further investigation.
- **Data Reliability:** The dataset has a low percentage of missing values at 4.7%, which is generally acceptable but still suggests the importance of data cleaning processes to ensure all records are complete for accurate analysis and decision-making.
- **Correlation Opportunity:** There is a strong correlation between 'age' (e.g., 30-40) and 'marital status' (Married), with 91 occurrences. This relationship could be leveraged by offering tailored health services, such as fertility treatments or family planning advice, to married individuals in their mid-to-late twenties.
- **Underperforming Segment:** The smallest category is 'Primary school', which appears only once across all entries. Given its low representation, this segment might indicate a need for educational programs or targeted interventions to improve health literacy and access among underprivileged populations.
- **Time-Based Opportunity:** Although datetime data does not exist in the dataset, segmentation based on categorical variables like 'age' (e.g., 18-22) could reveal trends over different age groups. For instance, individuals aged 18-22 might benefit from specific health education programs or services tailored to their life stage and reproductive health needs.
